TITLE: Sputtering of single crystals of III-V type semiconductors Report, Tenth Conference on Cathode Electronics held in Kiev, 11-16 Nov 1963

SOURCE: AN SSSR, Izvestiya, Seriya fizicheskaya, 28, no. 9, 1964, 1431-1438

TOPIC TAGS: cathode sputtering, single crystal, semiconductor, indium antimonide, gallium arsenide

ABSTRACT: Sputtering of single crystals of InSb and GaAs was investigated. These materials were chosen for study partly because of their technical importance, and partly to extend our knowledge of sputtering anisotropy to more complex crystal structures than the simple cubic structures previously investigated. It was also desired to obtain information concerning the relative sputtering rates of the different components of a compound. A sphere cut from a single crystal of the material under investigation was held at a negative potential of 1 to 3 KV in a plasma (pressure = 10^{-3} mm Hg; ion density = 10^{12} cm $^{-3}$; composition = unspecified), and the sputtered material was collected on the inner wall of a spherical glass shell sur-

1/2

tain crystallographic axes, was determined chemically, spectroscopically, and by means of electron diffraction. In addition to the usual circular spots of sputtered material, hexagonal spots were formed. These were centered in the [111] directions, and their corners were in the $\bar{1}\bar{1}0$ and $\bar{1}\bar{1}4$ directions. The hexagonal spots were more clearly developed for InSb than for GaAs. In the [111] directions the pattern was different: the [111] spots were very weak and the [114] spots were absent. It was determined by auxiliary experiments with dendritic crystals that the [111] directions, giving the hexagonal spots, correspond to the indium faces of the crystal. The general background of sputtered material and the spots formed in the [111] directions were found to consist only of the compound InSb. The hexagonal spots consisted also mostly of InSb, but they contained admixtures of free In in the [111], [110] and [114] directions. Free In was also found in the deposit in the $\bar{1}\bar{1}0$ (antimony) direction of dendritic crystals. The results are discussed in terms of the focusing effect in collisions within crystals (R.H.Silsbee, J.Appl.Phys. 38, 1546, 1967). It is concluded that not only the focusing effect, but also collisions near the surface are important. No satisfactory explanation was found for the difference

between the parameters in the [111] and [111] directions, nor for the preferential scattering of indium in the [110] direction. In conclusion, we express our gratitude to G. I. Sivov for his interest in the work and for valuable remarks, to M. B. Mirgolevskaya, E. Ya. Dashkovskiy and Yu. O. Val'yashko for making the dendritic InSb available and for valuable consultations, and also to V. V. Shakhmanov for his assistance in the electron diffraction studies." Orig. art. has: 4 figures.

TITLE: Some peculiarities of sputtering of metals connected with depth of penetration of the recoil atoms (Report, Ninth Conference on Cathode Electronics held in Kiev, 11-16 Nov 1963)

SOURCE: AN SSSR. Izvestiya. Seriya fizicheskaya, v.28, no.9, 1964, 1478-1482

COLLECTION TITLE: sputtering; single crystal; polycrystalline copper

The relative rate of sputtering of copper single crystals was measured as a function of the angle between the direction of the incident ions and the [110] plane of sputtering, and the sputtering rate of polycrystalline copper was determined as a function of the temperature and incident ion energy. The measurements were used to check qualitative conclusions drawn from the focused collision theory of sputtering (R.H. Stigman, J. Appl. Phys. 28, 1246, 1957). The measurements with single crystals were performed with spherical specimens and with cylinders cut with their axis parallel to the (100) plane. The spherical specimens were exposed to a hydrogen or deuterium plasma at 10^{-8} cm⁻³ while being held at a negative potential of

ACQUISITION NR. 4 26045304

was found that sputtering was most rapid in those parts of the specimen at which a [110] axis was normal to the surface. Since there are 12 such locations on the sphere, it was possible to determine the sputtering rate only for rather small inclinations of the [110] axis to the normal. The cylindrical specimens were bombarded by neon ion beams (incident normal) on the cylindrical surface. The specimen was rotated about its axis, and the sputtering rates for different orientations were determined from the density of the sputtered material deposited on a micaceous surface. With this arrangement it was possible to measure sputtering rates at much larger inclinations of the normally incident beam to the [110] axis. The sputtering rate was found to decrease rapidly with increasing inclination. The polycrystalline samples were sputtered at 200 and 800°C in a hydrogen plasma at potentials from 1 to 6 kV and by neon ion beams of energies from 15 to 30 keV. The sputtering rate was determined from the density of sputtered material deposited on glass. It was found that the maximum sputtering rate occurred for a lower incident ion energy at low higher temperatures. Neither the curves nor the extent of the shift of the maximum was given. The results are discussed briefly. The reduction of the sputtering rate when the [110] axis is highly inclined to the normal to the crystal sur-

TITLE: Anisotropy of reflection of argon ions from single crystal copper

SOURCE: Zh. eksper. i teor. fiz., v. 47, no. 2, 1964, 473-475

TOPIC TAGS: argon, copper, anisotropy, crystal lattice structure, single crystal, cubic crystal, ion bombardment

ABSTRACT: This investigation was undertaken to check on an earlier grapho-analytic calculation made by one of the authors (V. Ye. Yurasova, Izv. AN SSSR, seriya fiz., v. 28, 9, 1964). According to this calculation, the projections of the reflected-ion-yield maxima on the (100) plane should lie symmetrically on both sides of each of the close-packing directions [110] and [100] in that plane, and the angular separation between them should be ~45°; the reflection

Cord 1/4

ACCESSION NR: AP4043618

minima should correspond to the directions [110] and [100]. To check this hypothesis, the angular distribution was investigated of the ions reflected following bombardment of a (100) surface of a copper single crystal with argon ions at ~1.5 keV energy. The test setup is briefly described. The results have shown that the regularity of the crystal lattice influences the intensity of the ion reflection. The minimum of the reflection is observed in the direction of close atomic packing [110] and [100], with the ion reflection having a maximum between these two directions. The results obtained are in good agreement with the conclusions of the earlier grapho-analytic calculations and can be interpreted by assuming that the ions penetrate open channels along the close-packing directions in the face-centered cubic lattice. | ABSTRACT: | Single crystalline thin films of <u>indium antimonide</u> and <u>cadmium sulfide</u> have been deposited by cathodic sputtering (ion bombardment) on single crystalline substrate of rock salt, pyrophyllite, or mica. The advantages of cathodic sputtering over vaporization in vacuum were stressed in depositing thin films of materials whose components have very different vaporization rates. Both InSb and CdS are used in certain [unspecified] devices. The experimental apparatus, an evacuated glass tube, and operating conditions were described. The substrate was heated to a minimum 300°C in the case of InSb, or to 500°C in the case of CdS. The sample to | | |

be sputtered was InSb single crystal or sintered CdS powder. The electron diffraction or, in the case of thicker films (up to 3—5 μ), reflection patterns of the films on (100) cleavage surface of rock salt indicated a basically cubic structure, with (100) plane parallel to the (100) plane of the substrate. Different crystallographic orientations and hexagonal crystallites were also observed. Depending on sputtering conditions, the InSb films were produced having either n- or p-type conduction with carrier mobilities up to 13,000 $\text{cm}^2/\text{V}\cdot\text{sec}$ and 500 $\text{cm}^2/\text{V}\cdot\text{sec}$, respectively. Concentration of current carriers was of the same order as in the starting material. The resistivity and photosensitivity of CdS sputtered films were close to the corresponding values for bulk samples. Orig. art. has: 2 figures [JK]

| TITLE: Magnetic properties of Pervallloy films formed in ion bombardment /Review of the literature on the physics of thin ferromagnetic films held in the USSR and abroad/ | | |
| SOURCES: Akademiya Nauk SSSR. Izdatelstvo fizicheskoy literatury, 1965. | | |
| TOPIC-TACS: ferromagnetic thin film, pervallloy, magnetic property | | |
| ABSTRACT: The work was undertaken in view of the growing use of thin films in electronics and the consequent need for new and better film preparation techniques. Preparation of films by ion bombardment has a number of distinctive features and advantages (O.V.Spivak, V.B.Yurasova, O.A.Filippova, and T.N.Nikitina, Izv. Akademiya Nauk SSSR, Ser. Fiz., 29, p.11, 1964, and other papers by the Spivak group). Priority among these is good correspondence of the composition of the film with that of the initial sputtered material. One of the objections to the ion bombardment technique is that inert gas atoms, present in the discharge chamber, become imbedded in | | |
| Card 1/3 | | |

L 50392-65

ACCESSION NO.: AFO011447

the film and impair its properties. In the present experiments a series of films of different types of Permalloy were prepared in glow and arc discharges in an inert atmosphere. The orienting field was provided by a pair of Helmholtz coils. The substrates were glass, glass precoated with quartz, aluminum, aluminum cleansed by acidic etching, and rock salt. The substrates were washed before installation in the apparatus and then further cleansed by the discharge before deposition of the film. The films were investigated as regards some of their magnetic properties and subjected to chemical analyses for comparison with the composition of the starting materials. Moreover, selected electron diffraction patterns (one of each is reproduced) indicate that the Permalloy films were polycrystalline with a fine-grained structure. The films on uncleansed Al were of poor quality, but those on cleaned Al were similar to films deposited on glass. Some magnetic data on the films, including curves of the inverse switching time versus switching field, are given in tables and figures. The results show that given proper control of the sputtering conditions and parameters it is feasible to prepare by this technique Permalloy films with characteristics similar to those of films prepared by thermal evaporation; the attainable reproducibility is satisfactory; for example, the scatter of coercive forces values in a series of films was less than 10%. "In conclusion, we express

TITLE: Angular and energy distribution of ions reflected from single crystals of copper

JOURNAL: Fizika Strelbogo Tela, v. 6, no. 7, 1966, 2173-2181

TOPIC TAGS: copper, argon, ion bombardment, ion distribution, angular distribution, ion energy

ABSTRACT: This is a continuation of earlier work (Izv. AN SSSR ser. fiz. v. 28, 1470, 1964) where the angular distribution of ions reflected from the face of a single-crystal cube of copper was calculated by graphically plotting the trajectories of the ions under certain simplifying assumptions. The present article describes electronic-computer calculations of the angular and energy distributions of the reflected ions without these simplifications. The calculations pertain to the reflection of 3-kev copper ions and 2.2-kev argon ions from single crystals of copper, the bombarding ions being normally incident on the (100) face. It is shown that the maxima in the angular and the energy distributions are produced by ions reflected as a result of a definite number of collisions with the lattice atoms. The angular distribution of the ions reflected from the face of the single crystal is found to be anisotropic, the anisotropy

Card 1/2

L 05614-67

ACC NR: AP6024485

being larger for Cu⁺-Cu than for Ar⁺-Cu collisions. For ions reflected in a fixed solid angle, the energy spectrum consists of several distinct peaks corresponding to the collisions of definite multiplicity. The form of the spectrum depends on the direction of emission of the reflected ions. The authors thank O. B. Firssov, G. V. Spivak, Yu. V. Martynenko, and B. V. Panin for a discussion and remarks, and V. I. Shul'ga for help with the processing of the results. Orig. art. has: 5 figures.

Argon ion bombardment. The apparatus used is similar to that described previously by Yurasova et al. (ZhETF, 47, 473, 1964) except that the present collector arrangement was made mobile. The angular distribution within the hemisphere above the target, as a function of the two angles, azimuth angle ϕ and polar angle θ , was measured. The values of these angles were changed by rotating both the target and collector through 2° to 5° . The energy distribution of secondary particles on the ejection angle was studied by the retarding potential method. The

Card 1/2

L 07796-67

ACC NR: AP6033908

following conditions were made: 1) the maximum of the energy distributions corresponding to the most probable ejection energies were observed at 27--30 ev. The positions of the maxima are slightly dependent on the ejection directions of the secondary ions; 2) In contrast to the most probable energies, the mean energy of the ions is markedly dependent on the ejection directions and has a maximum value in the close-packed directions (110); 3) a higher percentage of slow ions (<20 ev) was detected in the spectra for directions far from (110); in these directions the ejection of particles from the target is difficult. The angular distribution of secondary electrons reveals a weak ϕ -anisotropy superimposed on a stronger but monotonous dependence on θ . Orig. art. has: 1 table and 4 figures.

Content of reducing substances and their dynamics during the air-conditioned fermentation of an industrial tobacco. G. I. Yuravskiy. U. S. S. R. State Inst. Tobacco Invent. Bull. 35, 23 pp. (1959). There is a decrease in individual and total carbohydrates in Cuban tobacco during air-conditioned fermentation, the amt. of decomposition varying directly with the units originally present but not with the heat developed. The amt. of decomposition during after-fermentation or aging is probably proportional to the original amt. of decomposition and to the diminished activity of the ferment. Poly- and disaccharides are hydrolyzed to simple sugars and undergo further decomposition. Maltose and monoses in some samples, on the other hand, increase at the expense of the more complex carbohydrates. Starch and dextrins decompose more slowly during aging than during fermentation. Aerobic conditions during the period of intensive fermentation of bales of tobacco are unfavorable to decomposition of sucrose, but its decomposition varies with the same in air-conditioned as in ordinary fermentation. During the former there is a decrease in phenols due to oxidation accompanied by a change in the color of the leaf blade. B. C. A.

PROBLEMS AND PROSPECTS MODE

INC AND STM CODES

The function of manure as a source of plant nourishment by means of carbon dioxide. Zdrav. Yurbitskij. Chemist. Socialist. Agr. (U.S.S.R.) 8, No. 6(1931); Chemic. & industrie 43, 430. -- The favorable influence of manure on the cultivation of cucumbers is partly due to the resultant improvement in assimilation of CO_2 by the plants. Application of mineral fertilizers, especially in conjunction with manure, also increases the liberation of CO_2 owing to the increased activity of the microorganisms which decompose the humus of the soil and of the manure. In the cultivation of sugar beet increased application of manure and the increased liberation of CO_2 increase the total sugar yield and the sugar content of the roots, but decreases the yield and area of the leaves.

| | | <p>Use of suspensions of poisonous powders in antilarval control. E. R. Yurchak and V. P. Bozhenko. Med. Parasitol. (U.S.S.R.) 8, 170-6 (1939) [French summary]; Rev. Applied Entomol. 28B, 7; cf. following abstr.—In eastern Kazakhstan expts. were made with aq. suspensions of Ca arsenite and of Paris green mixed with small amounts of kerosene or crude oil, sprayed over pools of water contg. larvae of <i>Aedes vexans</i> Mg. Paris green at 0.5, 0.7 and 0.9 lb. per acre gave 99.86, 100 and 100% mortality and Ca arsenite at 0.5-2.25 lb. per acre gave av. mortalities of 93.1-90.3%. Spraying with aq. suspensions of Ca arsenite without oil gave low mortality, and the oil or kerosene alone at 0.75-1.5 pints in 14 [litr.] gal. H₂O per acre showed no toxicity. The oil prevents the dust from sinking. An aq. suspension of Paris green was, however, effective against larvae of <i>Aedes</i> and <i>Culex</i> and gave complete mortality, in one instance in 4 hrs., when the poison was applied at 1.5 lb. per acre; Ca arsenite suspension at the same rate killed only 80-82% of the larvae.</p> | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Whitemare

Bright-red discoloration of chinaware. I. Ya. Ver.
CEAS. Selskogo i Krem. Pisma, 1944, No. 6, pp. 17-19.

During the war the chinaware industry was compelled to utilize raw materials that did not require long distance transportation. Among such materials used at the Kalinin chinaware factory was Lyubytin clay that had a somewhat higher content of Fe_2O_3 than the prewar clays. This clay, when used in bodies, produced undesirable discolorations that were often irregular, e.g., the bottom of a plate was not discolored or only slightly so, while the brim was badly discolored. It was observed that the discoloration was due to the Fe in the body, yet its appearance was controlled by the type of firing. Extensive testing showed that firing the body at cone 9 in an oxidizing atmosphere yielded a white unglazed product, while firing at the same cone in a reducing atmosphere gave a blistered light-red product. A continued firing of the green ware first in a reducing atmosphere at cone 9 and then in an oxidizing atmosphere at cone 9 yielded a badly blistered product of light-yellow color. Glaze firing in an oxidizing atmosphere at cone 9 retains the original color of the bisque. Glaze firing at cone 9 in a weakly reducing atmosphere colors a white bisque bright red. At the same time carbon particles become lodged in the glaze. Repeated firing of a bright-red bisque at cone 9 in an oxidizing atmosphere does not change its color. Repeated firing at cone 9 in an oxidizing atmosphere changes the red color to straw yellow. To study the effect of Fe_2O_3 and TiO_2 on discolorations to a white-firing body were added 1 and 2% of TiO_2 and 1.5 and 2.5% of Fe_2O_3 . These bodies were fired at a reducing atmosphere at cone 9. The body to which neither TiO_2 nor Fe_2O_3 was added fired white. The bodies containing TiO_2 fired gray, and those containing Fe_2O_3 fired yellow to bright red as the Fe_2O_3 content increased. The results indicate that bodies containing Fe_2O_3 should be fired in an

oxidizing atmosphere. A white-fired body containing Fe_2O_3 discolors if fired in a slightly reducing atmosphere. The discoloration in a bisque can be removed if it is re-fired at a higher temperature in an oxidizing atmosphere. It may be assumed that the Fe present in the body when fired in a reducing atmosphere is reduced to FeO and the latter forms almandine ($FeAlSiO_4$), which is a red mineral having a purple tint. This assumption must be tested further. M.Ilo

TITLE:

Porcelain-Faience-Industry on the Way of Technical Progress
(Farforo-fayansovaya promyshlennost' na putyakh tekhnicheskogo
progressa)

PERIODICAL:

Steklo i Keramika, 1957, Nr. 11, pp. 6 - 11 (USSR)

ABSTRACT:

The Scientific State Institute for Ceramics founded in 1919 played an important part in the investigation of domestic raw materials as well as of the rationalization of oldfashioned and used-up factory equipment and in consequence of its work this industry became independent from abroad. The problems of the thermal treatment of products was studied which made it possible to intensify the drying and burning process. At present the major part of operation processes in the production of masses and glazings is mechanized. The works for the introduction of progressive assembly are carried out successfully and lead to a considerable increase of capacity. A molding- and drying aggregate is introduced which is to increase the molding output 2 - 3 fold. In the faience factory imeni Kalinina the assembly

Card 1/3

72-11-3/9

Porcelain-Faience-Industry on the Way of Technical Progress

line of the drying plant is partly sheltered in two stories (figure 1) which increases the output of production per 1 m^2 of working place and excludes superfluous transport of semi-finished materials. The molding of teapots in progressive assembly increased considerably the output (figure 2). In figure 3 a scheme for the casting of products is shown. Remarkable works were done in the field of the drying of products, where in order to speed this process up, the method of the individual heating of products by means of infrared rays or hot-air current is to be introduced. Of great importance for this industry were the research- and construction works for the development of high-capacity tunnel kilns with hydraulic push-rods, which made possible the more rational organization of production. Most of the handwork is still being done in painting departments; but also here progressive assembly is being introduced to a great extent. Also the development of machines for the individual kinds of paintings are being designed. The present speed of development is, however, still regarded insufficient. Furthermore a whole number of improvements of products is mentioned which are to be carried out within the next years. Above all, however, the achievements of individual factories

Card 2/3

72-11-3/9

Porcelain-Faience-Industry on the Way of Technical Progress

should be given on to all the porcelain-faience industry; this is a further important task. There are 7 figures.

TITLE: The Latest Achievements in the Field of the Manufacturing Technology of Porcelain and Faience in the USSR (Noveyshiye dostizheniya v tekhnologii proizvodstva farfora i fayansa v SSSR)

PERIODICAL: Steklo i keramika, 1958, Nr 12, pp 5 - 7 (USSR)

ABSTRACT: By the introduction of assembly-lines in the factories an increase in output from 15 to 25% was obtained. The adoption of mechanized radiation-convection drying plants for the combined preliminary and final drying processes is to be regarded as the most important technical innovation, by which a considerable saving in drying times is made possible. A centralized silt supply to the working places has been arranged in the factories Baranovskiy, imeni Lomonosova, Dovbychskiy and others. Assembly-line operation for various mass products has been introduced in the molding shops and glaze departments of

Card 1/3 leading factories, partly retaining previous

The Latest Achievements in the Field of the Manufacturing Technology of Porcelain and Faience in the USSR

SOV/72-58-12-2/23

working methods. With the purpose of rationalizing the burning process of porcelain products, a tunnel kiln of the GIKI type of a length of 105 m and a width of 1.85 m was built in the Dulevskiy Porcelain Factory. Small electric furnaces are employed in the Porcelain Factory imeni Lomonosova for the first burning process of porcelain, with a resulting remarkable saving of time. In the Faience Factory imeni Kalinin, the first "slit furnace" (shchelevaya pech') as designed by the GIKI was built, allowing to hope that an additional saving of time may be achieved. Assembly-line operation was also introduced in the control and grinding departments for plane and concave products of the Baranovskiy Porcelain Factory. Decoration work in almost all factories has been changed to assembly-lines. The GIKI is at present working on the project of a muffle furnace for annealing colors by assembly-line procedure. Preparatory work has been carried out for the mechanization of other processes. Finally, the workers

TITLE: The Direction of Scientific and Construction Work in the Development of the Production of Household Porcelain and Faience in the Years 1959-1965 (Napravleniye nauchnykh i konstruktorskikh rabot po razvitiyu proizvodstva bytovogo farfora i fayansa v 1959-1965 gg.)

PERIODICAL: Steklo i keramika, 1959, Nr 5, pp 18 - 22 (USSR)

ABSTRACT: The Gosudarstvennyy nauchno-issledovatel'skiy keramicheskiy institut (State Scientific Research Institute of Ceramics) made experiments with prepared bentonite and special additions, such as polyvinyl alcohol. Thus solid, unburnt, non-softening products shall be obtained which can be glazed by the dipping method. The molding, casting, and drying of series products shall be mechanized by assembly-lines. The problems of dry pressing shall be solved and thus the technical problems of the manufacture considerably simplified. On the basis of experiments of the GIKI radiation high-speed drying plants for the manufacture of cups were developed and introduced. On the basis of these plants the work on the assembly-lines was arranged in such a way that the

Card 1/2

The Direction of Scientific and Construction Work in the SOV/72-59-5-7/23
Development of the Production of Household Porcelain and Faience in the Years
1959-1965

drying cycle of the cups could be reduced by 10 to 15 times. Porcelain and faience products are at present being checked and polished by manual labor which will be replaced by the development of corresponding semi-automations and by introducing adequate assembly-line work. The next task of the GIKI and the leading works is supposed to be the mechanization of the whole operation. Problems of automation are to be solved simultaneously. University departments, laboratories, heat engineering- and construction offices of the Councils of National Economy and factories, in addition to the State Scientific Research Institute of Ceramics, will participate in the performance of this work.

TITLE: Measuring the thermal conductivity of liquid metals

SOURCE: Tepl. fizika vysokikh temperatur, v. 2, no. 5, 1964, 696-701

TOPIC TAGS: liquid metal, thermal conductivity, electric conductivity, Lorentz number, PK L8 potentiometer

ABSTRACT: To supplement the few recorded thermal conductivity measurements of liquid metals, the authors performed earlier experiments in which the metals were subjected to periodic external heating. In the present work measurements were made by heating the specimen from within. This method allows larger temperature fluctuations. The theoretical basis for the measurements was developed starting with the equation for the temperature space-time distribution. Harmonic temperature variations were considered. By introducing complex variables, an expression for the temperature was obtained in terms of zero order Bessel functions of the first kind, and of zero order Hankel functions of the first kind. Experimentally, the metal was put in a crucible made of two thin-walled (0.1 mm) tantalum tubes (diameters 23.7 and 4 mm) positioned coaxially. One thermocouple (chromel-alumel 0.2 mm diameter) was soldered to the outer surface and the other placed in the liquid near the core 1/4

inner tube. A heater on the tube axis was automatically switched on and off in periodic heating of a controlled cycle. Tantalum sheets (0.1 mm) were positioned horizontally 10-15 mm apart to prevent convective mixing. Recorded temperature curves were nearly harmonic. The table shown on the enclosure presents

temperature curves were nearly harmonic. The table shown on the enclosure presents measurements for tin, one of the four test metals (Pb, Sn, Cd, Bi). It was shown that: 1) the thermal conductivity of Sn and Pb decreased by a factor of 1.65, and for Cd by 2.5 upon melting, while that of Bi increased by 2.6; 2) in the liquid phase, the thermal conductivity of all four metals was practically constant. The conductivity of the metals was calculated from the experimental values and from reference values of density and heat capacity. The results, compared to those previously determined, varied by as much as 50%. The electrical resistance of the metals was measured in a tantalum tube 24 cm long and 8 mm in diameter. The tube was heated, and a current was passed longitudinally, while the voltage was measured by a RMS-40 potentiometer. The values obtained compared well with previous results. The Lorentz numbers of metals were calculated and, at high temperatures, were found smaller than the theoretical "metallic" values by a factor of 2.45. This indicates that a theoretical interpretation should be attempted. Orig. art. has 3 tables, 4 figures, and 16 equations.

TITLE: Thermal properties of liquid tin and lead

SOURCE: "Topofizika vysokikh temperatur," v. 3, no. 2, 1965,
323-325

TOPIC: ~~Thermal properties of tin, lead, molten metal, thermal conductivity, specific heat, temperature conductivity, measurement method~~

ABSTRACT: The authors investigated the thermal conductivity, the temperature conductivity, and the specific heat of liquid tin and lead by means of a modification (internal heating variant) of a general method, the theory and experimental realization of which is described elsewhere (Vestn. Ross. Akad. Nauk, Ser. Tekhn. Nauk, 1964). In this method the internal surface of a hollow cylinder crucible, made of two coaxial tantalum tubes and filled with the investigated metal, is subjected to electron bombardment, the power of which is varied periodically in

time. A thermocouple on one of the points of the outer surface of the cylindrical register registers the periodic temperature variation. The method for registration of the temperature fluctuations and the device for regulation of the periodic time variation are described elsewhere (Inzh.-fiz. zh. No. 5, 1964; Zavodsk. laboratoriya no. 3, 1965). The method is based on the use of radial temperature waves. Its accuracy is within 3 per cent in measurement of specific heat, 3 -- 5 per cent in measurement of the temperature conductivity, and 6 -- 8 per cent in the measurement of the thermal conductivity. Plots of the measurements are prepared, made for various periods of electronic heating, and the results are in good agreement with each other. The measured values of the thermal conductivity were used to find the Lorentz numbers, which were found to decrease relatively rapidly with increasing temperature. At 200 -- 300° above the melting point the absolute values of the Lorentz number become much lower than the value $2.45 \times 10^{-8} \text{ W}\cdot\text{ohm}\cdot\text{deg}^{-2}$ given by the theory for solid metals. This agrees with results obtained by the authors earlier in a narrower temperature interval (Teplofizika vysokikh temperatur v. 2, no. 4, 1964) Original

13 mm. The molybdeum contained: 0.01% sesquioxides, 0.001% nickel, 0.001% silicon dioxide, and traces of calcium oxide. Results of heat capacity measurements at 150° are given in a table. It is stated that if the error of the heat capacity by both methods, the error should not exceed 5% for a 10% error in the liquid metal. Therefore, experiments with copper as a reference metal, diffusivity, radiation, and the mass of the crucible, this error can be reduced to 1.5-2.5%. A further table gives the results from measurements of the heat capacity of liquid metal at 150°. The table contains 44 formulas, 3 figures, and 2 tables.
